

# Replacing External Configuration Service with Chord Peer-to-Peer Protocol

Cloud Data Bases WS2021-22

*Group 13 - Final Project*

**Authors:**

David Silva  
Krisela Skenderi  
Lukas Bernwald

# Motivation

ECS - single point of failure of the database.

- Server Join
- Failure Detection (Heartbeat) and Recovery
- Metadata Update
- Replication
- Handoff

# Why Chord?

- **Decentralized**, scalable Peer-to-Peer system
- **Load-Balancing**: Based on Consistent Hashing
- **Efficient Lookups**:  $O(\log(n))$  lookup complexity
- **Low maintenance**: Only a few nodes are affected on server join/departure
- **Easy adaptation** from the previous system

# Chord overview - structure

$i^{th}$  entry corresponds to successor( $n + 2^{i-1} \bmod 2^m$ )

node identifier

$m$  = number of bits in  
key/node identifier

**FINGER TABLE OF N14**

# Client PUT - replication

# Server join - replication and handoff

- Replication factor 2
- Server 38 joins
- Handoff keys in range (21,38]
- Replicate to new node
- Delete stale replication data

# Server departure - replication and handoff

- Replication factor 2
- Server 47 leaves
- Handoff from  $[\text{pred}_{47}, 47]$  to 51
- Update replication

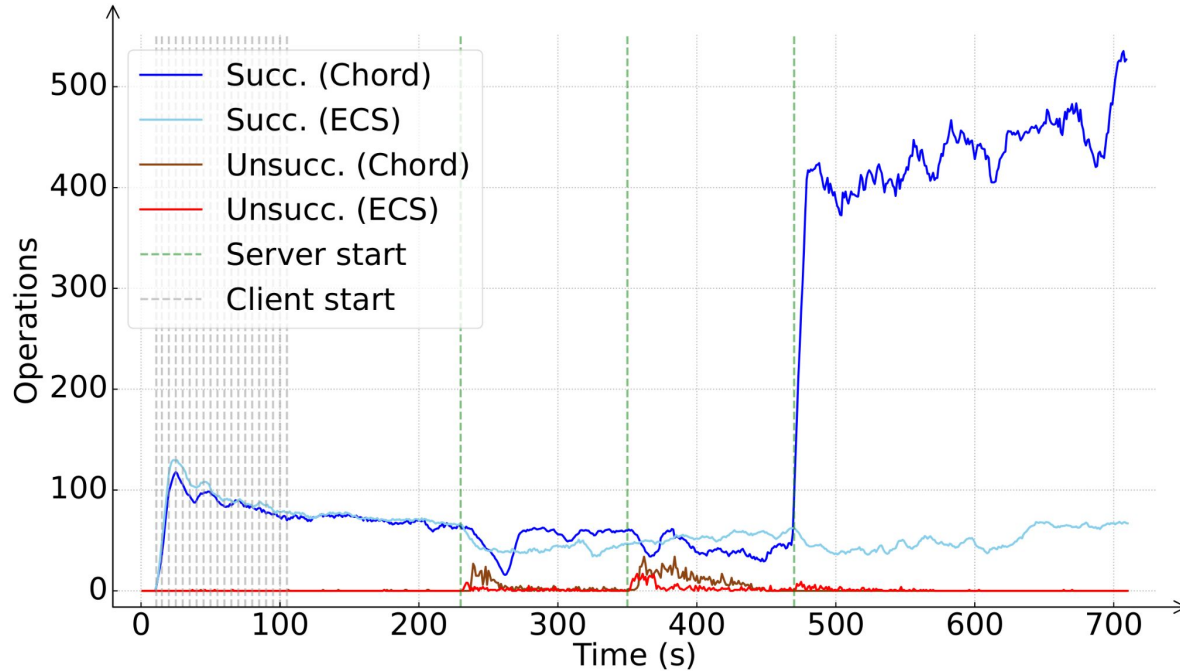

# Failure detection - check predecessor

# Experimental evaluation - overview

- Tool schedules timed events
  - Starts clients and servers
- Clients put, get and delete
- Dataset: Enron email
- 2 Experiments with ECS and Chord
  - LFU cache (500 size)
  - B-Tree minimum degree = 200
- Measure throughput and latency

# Experiment 1 - Behavior comparison

- 3 → 6 servers
- Replication factor = 1
- 0 → 20 clients

# Experiment 1 - Behavior comparison

- Request latency (in *ms*)

| ECS   |       |       | Chord |       |       |
|-------|-------|-------|-------|-------|-------|
| GET   | PUT   | DEL   | GET   | PUT   | DEL   |
| 272.2 | 329.9 | 359.8 | 30.7  | 266.3 | 268.8 |

# Experiment 2 - Replication performance

- 6 Servers (same settings), 20 Clients, variable replication factor

ECS

Chord

## Experiment 2 - Replication performance

- Request latency (in *ms*)

|              | ECS   |       |       | Chord |       |       |
|--------------|-------|-------|-------|-------|-------|-------|
| Repl. factor | GET   | PUT   | DEL   | GET   | PUT   | DEL   |
| 0            | 133.3 | 159.4 | 167.9 | 143.8 | 166.2 | 174.8 |
| 1            | 205.9 | 260.5 | 275.2 | 217.4 | 285.9 | 281.2 |
| 2            | 326.2 | 351.8 | 379.5 | 332.5 | 369.2 | 388.6 |

---

# Experimental evaluation - remarks

- Network latency and data distribution
- Eventual consistency
- Complexity of lookup operation:  $O(\log(n))$  compared to  $O(1)$
- Hardware limitations
- Non-deterministic behavior

# Conclusion

- More complex than ECS
  - Increased network communication
  - Eventual consistency
- Performs similarly to potentially better
- No Single Point of Failure
- Potentially higher scalability
- Further research needed

# Replacing External Configuration Service with Chord Peer-to-Peer Protocol
